INVESTOR IN PEOPLE

**PRIORITY DOCUMENT**  
SUBMITTED OR TRANSMITTED IN  
COMPLIANCE WITH  
RULE 17.1(a) OR (b)

The Patent Office  
Concept House  
Cardiff Road  
Newport  
South Wales  
NP10 8QQ

EP00 1863

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

## Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

## Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

Screening Method

5 The present invention relates to a novel regulatory site that leads to an increase in the activity of the mitochondrial proton leak and to the use of this site in a novel screening method for compounds which are useful in the treatment of body weight disorders and related co-morbid conditions, including, but not limited to, obesity, diabetes and dyslipidaemias.

10 Oxidative phosphorylation is the synthesis of adenosine triphosphate (ATP) from adenosine diphosphate (ADP) and inorganic phosphate ( $P_i$ ) by mitochondria driven by an electrochemical proton gradient that is established during the flow of electrons through the respiratory chain. During electron transfer, protons are pumped from the mitochondrial matrix into the intermembrane space. Protons  
15 diffuse back into the matrix through the ATP synthase producing ATP. However, not all of the proton back-flow occurs through ATP synthase. When oligomycin (an inhibitor of proton flow through the membrane domain of ATP synthase) is added to isolated mitochondria, the mitochondria still continue to consume oxygen at a low rate. This process is known as the "proton leak" (Brand et al, *Biochimica et*  
20 *Biophysica Acta* 1187 (1994) 132-139). This proton leak across the mitochondrial inner membrane is estimated to account for as much as 35-50% of skeletal muscle respiration (Rolfe D.F.S. and Brand M.D. (1996) *Am. J. Physiol.* 271S C1380-C1389). In the absence of oxidative phosphorylation all the protons pumped by the respiratory chain out of the mitochondria return into the mitochondria by this  
25 proton leak.

The mitochondrial proton leak constitutes a significant proportion of the basal metabolic rate of an organism. Hitherto, there have been no known acutely acting regulators of this biological process. However, an increase of 15% in skeletal  
30 muscle mitochondria respiration rate (state 4) caused by supraphysiological concentrations (4.16 mM) of cytidine monophosphate (CMP) has recently been reported (Jekabsons M. and Horwitz B.A. (1998) *FASEB J.* 12, n° 5, part II, 4714). The authors suggested a possible CMP regulation of proton leak in skeletal muscle mitochondria. However, our results did not confirm this effect at concentrations of up  
35 to 1mM. In our systematic examination of the effects of fifteen nucleotides on

skeletal muscle mitochondria it has surprisingly been found that only one nucleotide had an effect at physiologically relevant concentrations.

- The present invention provides a strategy for screening for compounds that
- 5 activate the mitochondrial proton leak by interacting at this novel regulatory site. Compounds shown to activate the proton leak can now be tested in the presence or absence of AMP. A lack of an additive effect indicates that the compound was interacting at this novel site. Compounds which activate this novel AMP regulated proton leak will increase the basal metabolic rate and hence may be useful in
- 10 treating obesity and related conditions.

The present invention provides a screening method for the identification of compounds which activate an AMP-sensitive regulatory site on mitochondria comprising the steps of:

- 15 a) contacting a test compound with mitochondria in the presence of a substrate for respiration in the presence of a buffer system ;
- b) measuring the oxygen consumption; and
- c) identifying compounds which increase oxygen consumption.

- 20 Preferably the method further comprises the steps of a) contacting the compounds identified with mitochondria in the presence of AMP and measuring the oxygen consumption; and b) comparing the oxygen consumption in the presence of AMP and the absence of AMP and thus identifying compounds where there is not an additive effect on oxygen consumption as compounds which activate the AMP-
- 25 sensitive regulatory site.

The present invention also provides a screening method for the identification of compounds which activate an AMP-sensitive regulatory site on mitochondria comprising the steps of:

- 30 a) contacting a test compound with mitochondria in the presence of a substrate for respiration in the presence of a buffer system;
- b) measuring the membrane potential; and
- c) identifying compounds which decrease the membrane potential.

- 35 Preferably the method which further comprises the steps of a) contacting the compounds identified with isolated mitochondria in the presence of AMP and

measuring membrane potential, and b) comparing the membrane potential in the presence of AMP and the absence of AMP and thus identifying compounds where there is not an additive effect on membrane potential as compounds which activate the AMP-sensitive regulatory site.

5

The present invention also provides a screening method for the identification of compounds which activate an AMP-sensitive regulatory site on mitochondria comprising the steps of:

- a) contacting a test compound with mitochondria in the presence of a substrate for respiration in the presence of a buffer system;
- 10 b) measuring the oxygen consumption and measuring the membrane potential; and
- c) identifying compounds which increase oxygen consumption and which decrease the membrane potential.

15

Preferably the method further comprises the steps of a) contacting the compounds identified with mitochondria in the presence of AMP and measuring the oxygen consumption and measuring the membrane potential; and b) comparing the oxygen consumption and the membrane potential in the presence of AMP and the  
20 absence of AMP and thus identifying compounds where there is not an additive effect on oxygen consumption and the membrane potential as compounds which activate the AMP-sensitive regulatory site.

25

Suitably, the mitochondria are isolated mitochondria or are present in intact cells. Preferably, the mitochondria are isolated skeletal muscle mitochondria. More preferably the mitochondria are isolated rat skeletal muscle mitochondria. Preferably the mitochondria are present in intact eukaryotic cells or are present in tissue slices of mammalian origin or cell lines of mammalian origin.

30

Suitably any substrate for respiration may be used. Preferably the substrate for respiration is a succinate salt, a glutamate salt or a malate salt, for example as a potassium salt or a sodium salt. More preferably, the substrate is a succinate salt, for example potassium succinate or sodium succinate. Preferably the screening method is carried out in the presence of an inhibitor of the utilisation of other  
35 endogenous substrates (a complex 1 inhibitor). When a succinate salt is employed

then the screening method is preferably carried out in the presence of rotenone to inhibit the utilisation of other endogenous substrates.

5 Preferably, the screening method is carried out in varying concentrations of an electron transport inhibitor. More preferably, the electron transport inhibitor is selected from a malonate salt, myxothiazol or a cyanide salt. Most preferably, the electron transport inhibitor is a malonate salt, for example the sodium or the potassium salt.

10 When membrane potential is being measured then the screening method is preferably carried out in the presence of a proton/potassium exchanger, for example nigericin, to minimise the pH gradient.

15 Membrane potential is preferably measured using a) ion selective electrodes for methyltriphenylphosphonium cation (TPMP) (or tetraphenylphosphonium cation (TPP)) wherein TPMP (or TPP) has been added to the test system or b) by using fluorescent membrane potential dyes wherein changes in membrane potential are measured by a fluorimeter which records the changes in the fluorescent response due to partitioning. A suitable dye is (dimethyl(aminostyryl)-1-methyl pyridinium (DSMP)) which may be used to measure membrane potential in both intact cells and  
20 isolated mitochondria.

Preferably the oxygen consumption and/or the membrane potential measurements are carried out in the presence of an inhibitor of ATP synthesis for  
25 example oligomycin.

Preferably the oxygen consumption is measured using an oxygen electrode.

The term buffer system is used herein to mean a system capable of  
30 supporting mitochondria and comprises a buffering agent, for example HEPES, and an osmotic protector, for example KCl. The buffering system optionally further comprises a chelating agent, for example EGTA, and/or an inorganic phosphate, for example potassium dihydrogen phosphate, and/or a free fatty acid scavenger, for example defatted BSA.

35

The term "associated co-morbid conditions" as used in this document means medical conditions known to those skilled in the art to be associated with body weight disorders. The term includes but is not limited to the following: diabetes including non-insulin dependent diabetes mellitus, impaired glucose tolerance, lipid syndromes, hyperglycaemia and hyperlipidaemia, high uric acid levels and lipid levels, in mammals particularly humans.

In addition the present invention may be useful in identifying compounds for the treatment or prevention of metabolic diseases and conditions arising therefrom, for example non exercise activity thermogenesis and increased metabolic rate, weight gain associated with drug treatment, osteoarthritis and gout, cancers associated with weight gain, menstrual dysfunction or gallstones.

The present invention may be useful in identifying compounds for preventing cardiovascular disease, in aiding weight loss after pregnancy and in aiding weight loss after smoking cessation.

#### EXPERIMENTAL PROCEDURES

The effect of adenosine, guanosine, cytidine, thymidine and uridine mono- di- and triphosphates at a concentration of 1 mM on the state 4 respiration rate (defined below) and proton leak of rat skeletal muscle mitochondria was studied.

##### Isolation of skeletal muscle mitochondria.

Female Wistar rats (4-8 wk old) were killed by stunning followed by cervical dislocation and the skeletal muscle was immediately dissected from the hindlimbs, weighed and placed in pre-weighed beaker containing C-P 1 medium (0.1 M KCl, 0.05 M Tris-HCl, 2 mM EGTA, pH 7.4). Mitochondria were isolated according to the methods of Chappell J.B. and Perry S.V. (1954) *Nature* (London) 173, 1094-1095 and Bhattacharya *et al.* (1991) *Anal. Biochem.* 192, 344-349. Briefly, the tissue was placed on a pre-cooled porcelain tile and shredded with a sharp blade. The tissue was minced and washed further by chopping with a sharp scissors and rinsing with C-P 1 medium 4-5 times and then drained of medium and left stirring in a beaker on ice containing C-P 2 medium (0.1 M KCl, 0.05 M Tris-HCl, 2 mM EGTA, 1 mM ATP, 5 mM MgCl<sub>2</sub>, 0.5% bovine serum albumin (BSA), and 18.7 U protease (nagarse)/g

- tissue, pH 7.4) for 4 min. The tissue was homogenised in the same medium using a Polytron tissue homogeniser. The homogenised tissue was left stirring in the same medium on ice for a further 6 min and then was centrifuged at 490g for 10 min. The supernatant was filtered through muslin and again centrifuged at 10368g for 10 min.
- 5 The mitochondrial pellets were resuspended in C-P 1, combined and centrifuged again at 10368g for 10 min. A last centrifugation was performed at 3841g and finally the pellet was resuspended in approx. 500  $\mu$ l of C-P 1. Protein concentration was determined by the Biuret method.
- 10 Measurement of Oxygen Consumption.
- The respiration rate was measured in the absence of adenosine diphosphate (ADP) (state 4) and presence of oligomycin (to inhibit any ATP synthesis) as a crude indicator of mitochondrial proton conductance. Oxygen consumption was measured
- 15 using a Clark-type oxygen electrode (Hansatech, Great Britain) maintained at 37°C. Prior to any experimental runs, the linearity of the oxygen electrode was routinely checked by measuring the uncoupled rate (i.e. the respiratory rate in the presence of the uncoupler (FCCP) at 0.2  $\mu$ M) and the oxygen electrode was calibrated with the appropriate volume of oxygenated medium (i.e. medium equilibrated with air). The
- 20 oxygen concentration of air-saturated medium at 37°C was assumed to be 406 nmol/ml (Reynafarje B *et al.* (1985). *Anal. Biochem.* 145, 406-418). Oxygen consumption was measured in the absence (state 4) and in the presence (state 3) of 250  $\mu$ M ADP. The skeletal muscle mitochondria respiratory control ratio (state 3/state 4 oxygen consumption) was around 4.0 with succinate as substrate. For the
- 25 measurements, 0.5 mg of mitochondrial protein per ml of assay medium (120 mM KCl, 5 mM KH<sub>2</sub>PO<sub>4</sub>, 3 mM HEPES, 1 mM EGTA and 0.3% defatted BSA, pH 7.2) was added to the oxygen electrode chamber followed by 5  $\mu$ M rotenone, 1  $\mu$ g/ml oligomycin and 4 mM succinate. Afterwards, adenosine, guanosine, cytidine, thymidine and uridine mono- di- and triphosphates were added to the oxygen
- 30 electrode chamber at a concentration of 1 mM. The pH of each nucleotide solution was brought to 6-7 so that no modification in the pH of the reaction mixture occurred after their addition.

Measurement of proton leak.

The rate at which protons cycle across the mitochondrial inner membrane, which does not contribute to ATP synthesis by oxidative phosphorylation, is given by the relationship observed between mitochondrial membrane potential and oxygen consumption rate during titration with electron transport chain inhibitors. This is a non-linear relationship, which suggests that the rate of dissipation of redox energy varies with membrane potential (Brown G.C. and Brand M.D. (1991) *Biochim. Biophys. Acta* 1059, 55-62). We determined the respiration rate and mitochondrial membrane potential simultaneously using oxygen electrodes and electrodes sensitive to the potential-dependent probe TPMP<sup>+</sup>, and established the kinetic response of the proton leak to potential during titrations of the potential with inhibitors of electron transport (Brand M.D. (1995) *Bioenergetics. A practical approach* (Brown G.C. and Cooper C.E., eds.), IRL Press, pp. 39-62). For each run, 0.5 mg of mitochondrial protein per ml of assay medium (120 mM KCl, 5 mM KH<sub>2</sub>PO<sub>4</sub>, 3 mM HEPES, 1 mM EGTA and 0.3% defatted BSA, pH 7.2) was added to the oxygen electrode chamber. Prior to measurements the electrode was calibrated with sequential additions of up to 2  $\mu$ M TPMP. 5  $\mu$ M rotenone was added to prevent respiration on endogenous NAD-linked substrates. 1  $\mu$ g/ml oligomycin inhibited mitochondrial ATP synthase and 75 ng/ml nigericin was added to bring the difference in pH across the inner mitochondrial membrane close to zero. 4 mM succinate was used as substrate. Additions of malonate up to 2 mM were sequentially performed. At the end of each run, the uncoupler FCCP at 0.2  $\mu$ M was added to dissipate the membrane potential, so that the TPMP was released by the mitochondria back to the medium. TPMP binding correction for skeletal muscle was taken to be 0.35 ( $\mu$ l/mg protein)<sup>-1</sup> (Rolfe D.F.S. *et al.* (1994) *Biochim. Biophys. Acta* 1118, 405-416.).

Determination of free Mg<sup>2+</sup> concentration.

Free Mg<sup>2+</sup> concentration was determined from total Mg<sup>2+</sup> in the assay medium. Apparent stability constants were calculated from absolute stability constants taken from (Fabiato A. and Fabiato A. (1979) *J. Physiol. Paris*, 75, 463-505) at a precise temperature and ionic strength.

## RESULTS

The effects of adenosine, guanosine, cytidine, thymidine and uridine mono-di- and triphosphates at 1 mM on the state 4 respiration rate of rat skeletal muscle mitochondria were examined. In resting muscle, the physiological concentration of ATP is 4 mM and of ADP is 0.013 mM. All nucleoside triphosphates as well as AMP showed an increase in the state 4 rate (41-75% for nucleoside triphosphates and 38% for AMP; figure 1). The nucleoside triphosphates all stimulated respiration by 60% in the absence of added Mg or EDTA, but this was entirely explained by chelation of endogenous contaminating Mg, which is a potent inhibitor of the basal proton conductance in muscle mitochondria. Cadenas S., et al. 8<sup>th</sup> Int. Congr. Obesity, Paris. Abstract HTP10 (1998).

At  $Mg^{2+}$  concentrations in the assay medium up to 2 mM, no effect of any nucleotide on state 4 rate was found, except for 1 mM AMP, which again stimulated the rate. When EDTA, which chelates  $Mg^{2+}$  very efficiently (apparent binding constant equals  $390788.33 M^{-1}$ , pH 7.2), was present at 1 mM in the assay medium, it abolished the effect of nucleoside triphosphates on respiration rate.

The observed increase in the respiration rate caused by the addition of 1 mM AMP was further confirmed by measuring the proton leak curves in the presence of 1 mM EDTA (figure 2). Figure 3 shows the respiration rate dependence on AMP concentration up to 2 mM (a) and up to 0.5 mM (b).

Both methods, state 4 respiration rate and proton leak measurements gave the same result: proton conductance in rat skeletal muscle mitochondria was stimulated by AMP, with half-maximal effects at about 100  $\mu M$ .

## FIGURE LEGENDS

Figure 1. Effect of nucleoside mono-, di- and triphosphates at 1 mM on rat skeletal muscle mitochondria respiration rate (% state 4). Data are mean  $\pm$  SEM of three rats done in triplicate.

**Figure 2.** Proton leak curves in the presence or absence of 1 mM AMP (assay medium containing 1 mM EDTA). Data are mean  $\pm$  SEM of three rats done in triplicate.

- 5 **Figure 3.** Effect of AMP from 0.25 to 2 mM (a) and from 0.05 to 0.5 mM (b) on rat skeletal muscle respiration rate (% state 4). Data are mean  $\pm$  SEM of three rats done in triplicate.

Claims

1. A screening method for the identification of compounds which activate an AMP-sensitive regulatory site on mitochondria comprising the steps of:
  - 5 a) contacting a test compound with mitochondria in the presence of a substrate for respiration in the presence of a buffer system;
  - b) measuring the oxygen consumption; and
  - 10 c) identifying compounds which increase oxygen consumption.
2. A method according to claim 1 which further comprises the steps of:
  - a) contacting the compounds identified in claim 1 with mitochondria in the presence of a substrate for respiration in the presence of a buffer system and in the presence of AMP and measuring the oxygen consumption; and
  - 15 b) comparing the oxygen consumption in claim 1 step (b) and claim 2 step (a) and identifying compounds where there is not an additive effect on oxygen consumption as compounds which activate the AMP-sensitive regulatory site.
3. A screening method for the identification of compounds which activate an AMP-sensitive regulatory site on mitochondria comprising the steps of:
  - 20 a) contacting a test compound with mitochondria in the presence of a substrate for respiration in the presence of a buffer system;
  - b) measuring the membrane potential; and
  - c) identifying compounds which decrease the membrane potential.
- 25 4. A method according to claim 3 which further comprises the steps of:
  - a) contacting the compounds identified in claim 3 with mitochondria in the presence of a substrate for respiration in the presence of a buffer system and in the presence of AMP and measuring membrane potential, and
  - 30 b) comparing the membrane potential in claim 3 step (b) and claim 4 step (a) and identifying compounds where there is not an additive effect on membrane potential as compounds which activate the AMP-sensitive regulatory site.
- 35 5. A screening method for the identification of compounds which activate an AMP-sensitive regulatory site on mitochondria comprising the steps of:

11

- a) contacting a test compound with mitochondria in the presence of a substrate for respiration in the presence of a buffer system;
  - b) measuring the oxygen consumption and measuring the membrane potential; and
  - 5 c) identifying compounds which increase oxygen consumption and decrease the membrane potential.
6. A method according to claim 5 which further comprises the steps of
  - 10 a) contacting the compounds identified in claim 6 with mitochondria in the presence of a substrate for respiration in the presence of a buffer system and in the presence of AMP, measuring the oxygen consumption and measuring the membrane potential; and
  - b) comparing the oxygen consumption and the membrane potential in claim 5 step (b) and claim 6 step (a) and identifying compounds where there is not an
  - 15 additive effect on oxygen consumption and membrane potential as compounds which activate the AMP-sensitive regulatory site.
7. A method according to any one of claims 1 to 6 wherein the mitochondria are isolated mitochondria.
  - 20 8. A method according to any one of claims 1 to 6 wherein the mitochondria are skeletal muscle mitochondria.
  9. A method according to claim 8 wherein the skeletal muscle mitochondria are
  - 25 rat skeletal muscle mitochondria.
  10. A method according to any one of claims 1 to 6 wherein the mitochondria are present in intact eukaryotic cells.
  - 30 11. A method according to claim 10 wherein the intact cells present in tissue slices of mammalian origin or cell lines of mammalian origin.
  12. A method according to any one of claims 1 to 6 wherein a complex 1 inhibitor is present.

35

13. A method according to any one of claims 1 to 6 wherein the substrate is a succinate salt.
14. A method according to claim 13 wherein rotenone is present.
- 5 15. A method according to any previous claim wherein the screening method is carried out in the presence of varying concentrations of an electron transport inhibitor.
- 10 16. A method according to claim 15 wherein the electron transport inhibitor is selected from a malonate salt, myxothiazol or cyanide salt.
17. A method according to claim 16 wherein the electron transport inhibitor is a malonate salt.
- 15 18. A screening method according to any one of claims 1, 2, or 5-17 wherein the oxygen consumption is measured by an oxygen electrode.
19. A screening method according to any one of claims 3 to 17 wherein the membrane potential is measured using ion selective electrodes.
- 20 20. A screening method according to any one of claims 3 to 17 wherein the membrane potential is measured using fluorescent membrane potential dyes.
- 25 21. A screening method according to any previous claim wherein an inhibitor of ATP synthesis is present.

ABSTRACT

- 5        The present invention provides a screening method for the identification of compounds which activate an AMP-sensitive regulatory site on mitochondria comprising the steps of:
- a)        contacting a test compound with mitochondria in the presence of a substrate for respiration in the presence of a buffer system ;
- 10    b)        measuring the oxygen consumption; and
- c)        identifying compounds which increase oxygen consumption. Alternatively or additionally membrane potential can be measured

Figure 1. Effect of mono-, di- and triphosphate nucleosides at 1 mM on rat skeletal muscle mitochondria respiration rate (% state 4). Data are mean  $\pm$  SD of three rats done in triplicate.

Figure 2 Proton leak curves in the presence or absence of 1 mM AMP (assay medium containing 1 mM EDTA). Data are mean  $\pm$  SD of three rats done in triplicate.

Figure 3. Effect of AMP from 0.25 to 2 mM (a) and from 0.05 mM to 0.5 mM (b) on rat skeletal muscle respiration rate (% state 4). Data are mean  $\pm$  SD of three rats done in triplicate.
